Thiacloprid; Pesticide Tolerances

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This regulation establishes tolerances for combined residues of thiacloprid ([3-[(6-chloro-3-pridinyl)[methyl]-2-thiazolidinylidene]cyanamide) and metabolites retaining the thiazolidine ring intact, measured and expressed in terms of thiacloprid, per se, in or on apple, wet pomace; cotton, undelinted seed; cotton, gin by-products; fruit, pome group 11; fat, meat, liver, kidney and meat by-products of cattle, sheep, goat and horse; and milk. Bayer CropScience requested these tolerances under the Federal Food, Drug, and Cosmetic Act (FFDCA), as amended by the Food Quality Protection Act of 1996 (FQPA).

DATES: This regulation is effective September 26, 2003. Objections and requests for hearings, identified by the docket ID number OPP-2003–0304, must be received on or before November 25, 2003.

ADDRESSES: Written objections and hearing requests may be submitted electronically, by mail, or through hand delivery/courier. Follow the detailed instructions as provided in Unit VI. of the SUPPLEMENTARY INFORMATION.

FOR FURTHER INFORMATION CONTACT: Marilyn Mautz, Registration Division, 7505C, Office of Pesticide Programs, Environmental Protection Agency, 1200 Pennsylvania Ave., NW., Washington, DC 20460–0001; telephone number: 703 305–6785; e-mail address: mautz.marilyn@epa.gov.

SUPPLEMENTARY INFORMATION:

I. General Information

A. Does this Action Apply to Me?

You may be potentially affected by this action if you are an agricultural producer, food manufacturer, or pesticide manufacturer. Potentially affected entities may include, but are not limited to:

- Crop production (NAICS 111)
- Animal production (NAICS 112)
- Food manufacturing (NAICS 311)
- Pesticide manufacturing (NAICS 32532)

This listing is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be affected by this action. Other types of entities not listed in this unit could also be affected. The North American Industrial Classification System (NAICS) codes have been provided to assist you and others in determining whether this action might apply to certain entities. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed under FOR FURTHER INFORMATION CONTACT.

B. How Can I Get Copies of this Document and Other Related Information?

1. Docket. EPA has established an official public docket for this action under docket identification (ID) number OPP–2003–0304. The official public docket consists of the documents specifically referenced in this action, any public comments received, and other information related to this action. Although a part of the official docket, the public docket does not include Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. The official public docket is the collection of materials that is available for public viewing at the Public Information and Records Integrity Branch (PIRIB), Rm. 119, Crystal Mall #2, 212 Jefferson Davis Hwy., Arlington, VA. This docket facility is open from 8:30 a.m. to 4 p.m., Monday through Friday, excluding legal holidays. The docket telephone number is (703) 305–5805.

2. Electronic access. You may access this Federal Register document electronically through the EPA Internet under the “Federal Register” listings at http://www.epa.gov/fedregstr/. A frequently updated electronic version of 40 CFR part 180 is available at http://www.access.gpo.gov/nara/cfr/cfrhtml_00/Tfde_40/40cf180_00.html, a beta site currently under development. To access the OPPTS Harmonized Guidelines referenced in this document, go directly to the guidelines at http://www.epa.gov/opptsfrs/home/guidelin.htm.

An electronic version of the public docket is available through EPA’s electronic public docket and comment system, EPA Dockets. You may use EPA Dockets at http://www.epa.gov/edocket/ to submit or view public comments, access the index listing of the contents of the official public docket, and to access those documents in the public docket that are available electronically. Although not all docket materials may be available electronically, you may still access any of the publicly available docket materials through the docket...
facility identified in Unit I.B.1. Once in the system, select “search,” then key in
the appropriate docket ID number.

II. Background and Statutory Findings

In the Federal Register of May 7, 2003
(68 FR 24458) (FRL–7303–7), EPA
issued a notice pursuant to section 408
of FFDCA, 21 U.S.C. 346a, as amended
by FQPA (Public Law 104–170),
announcing the filing of a pesticide
petition (PP 9F6060) by Bayer
CropScience, P.O. Box 12014, 2 T.W.
Alexander Dr., Research Triangle Park,
NC 27709. That notice included a
summary of the petition prepared by
Bayer CropScience, the registrant. There
were no comments received in response
to the notice of filing.

The petition requested that 40 CFR
part 180 be amended by establishing
tolerances for residues of the
insecticide, thiacloprid, in or on apple,
wet pomace; cattle, meat and meat
byproducts; cotton, gin byproducts;
cotton, undelinted seed; fruit, pome,
group 11; and milk at 0.6; 0.2; 11.0; 1.0;
0.3; and 0.1 parts per million (ppm),
respectively. Upon review and
evaluation of the data submitted in
support of the petition, the Agency
determined that the residues of concern
are thiacloprid plus metabolites
retaining the thiazolidine ring intact.
Excluded from the residues of concern
are metabolites such as 6-nicotinic acid
(6-CNA) for which the thiazolidine ring
is broken. These metabolites are
excluded based on the finding that the
toxic effects of thiacloprid are
less stable than the chloropyridine ring,
entire thiacloprid molecule (with both
the thiazolidine ring and the
chloropyridine ring intact). Because
metabolism and degradation studies
have shown that the thiazolidine ring is
less stable than the chloropyridine ring,
it is understood that metabolites
retaining the thiazolidine ring also
retain the chloropyridine ring intact.

Section 408(b)(2)(A)(i) of the FFDCA
allows EPA to establish a tolerance (the
legal limit for a pesticide chemical
residue in or on a food) only if EPA
determines that the tolerance is “safe.”
Section 408(b)(2)(A)(ii) of the FFDCA
defines “safe” to mean that “there is a
reasonable certainty that no harm will
result from aggregate exposure to the
pesticide chemical residue, including
all anticipated dietary exposures and all
other exposures for which there is
reliable information.” This includes
exposure through drinking water and in
residential settings, but does not include
occupational exposure. Section
408(b)(2)(C) of the FFDCA requires EPA
to give special consideration to exposure of infants and children to the
pesticide chemical residue in
establishing a tolerance and to “ensure
that there is a reasonable certainty that
no harm will result to infants and
children from aggregate exposure to the
pesticide chemical residue....”

EPA performs a number of analyses to
determine the risks from aggregate
exposure to pesticide residues. For
further discussion of the regulatory
requirements of section 408 of the
FFDCA and a complete description of
the risk assessment process, see the final
rule on Bifenthrin Pesticide Tolerances
(62 FR 62961, November 26, 1997)
(FRL–5754–7).

III. Aggregate Risk Assessment
and Determination of Safety

Consistent with section 408(b)(2)(D)
of the FFDCA, EPA has reviewed the
available scientific data and other
relevant information in support of this
action. EPA has sufficient data to assess
the hazards of and to make a
determination on aggregate exposure,
consistent with section 408(b)(2) of
the FFDCA, for tolerances for combined
residues of thiacloprid and metabolites...
retaining the thiazolidine ring intact, measured and expressed in terms of thiacloprid, per se on apple, wet pomace; cattle, sheep, goat and horse meat; meat byproducts; liver; kidney; and fat; cotton, undelinted seed; cotton, gin byproducts; fruit, pome, group 11; and milk at 0.6; 0.03; 0.05; 0.15; 0.05; 0.02; 0.02; 11.0; 0.3; and 0.03 ppm, respectively. EPA’s assessment of exposures and risks associated with establishing the tolerance follows.

### A. Toxicological Profile

EPA has evaluated the available toxicity data and considered its validity, completeness, and reliability as well as the relationship of the results of the studies to human risk. EPA has also considered available information concerning the variability of the sensitivities of major identifiable subgroups of consumers, including infants and children. The nature of the toxic effects caused by thiacloprid are discussed in Table 2 of this unit as well as the no-observed-adverse-effect-level (NOAEL) and the lowest-observed-adverse-effect-level (LOAEL) from the toxicity studies reviewed.

<td>A 5% dermal absorption value is appropriate for estimating the risk resulting from dermal exposure to Thiacloprid formulated as a 40.4% liquid formulation (SC 480). This 5% value is also appropriate for other liquid thiacloprid formulations that are similar to the SC 480 liquid formulation product tested and for aqueous dilutions of most thiacloprid formulations.</td>
</tr>
</tbody>
</table>

### B. Toxicological Endpoints

The dose at which no adverse effects are observed (the NOAEL) from the toxicology study identified as appropriate for use in risk assessment is used to estimate the toxicological level of concern (LOC). However, the lowest dose at which adverse effects of concern are identified (the LOAEL) is sometimes used for risk assessment if no NOAEL was achieved in the toxicology study selected. An uncertainty factor (UF) is applied to reflect uncertainties inherent in the extrapolation from laboratory animal data to humans and in the variations in sensitivity among members of the human population as well as other unknowns. An UF of 100 is routinely used, 10X to account for interspecies differences and 10X for intra species differences. As explained in Unit III.D.3., EPA determined that the FQPA SF be reduced to 3X. For dietary risk assessment (other than cancer) the Agency uses the UF to calculate an acute or chronic reference dose (acute RfD or chronic RfD) where the RfD is equal to the NOAEL divided by the appropriate UF (RfD = NOAEL/UF). Where an additional safety factor (SF) is retained due to concerns unique to the FQPA, this additional factor is applied to the RfD by dividing the RfD by such additional factor. The acute or chronic Population Adjusted Dose...
(aPAD or cPAD) is a modification of the RID to accommodate this type of FQPA SF.

For non-dietary risk assessments (other than cancer) the UF is used to determine the LOC. For example, when 100 is the appropriate UF (10X to account for interspecies differences and 10X for intraspecies differences) the LOC is 100. To estimate risk, a ratio of the NOAEL to exposures (margin of exposure (MOE) = NOAEL/exposure) is calculated and compared to the LOC.

The linear default risk methodology (Q*) is the primary method currently used by the Agency to quantify carcinogenic risk. The Q* approach assumes that any amount of exposure will lead to some degree of cancer risk. A Q* is calculated and used to estimate risk which represents a probability of occurrence of additional cancer cases (e.g., risk is expressed as 1 x 10^-6 or one in a million). Under certain specific circumstances, MOE calculations will be used for the carcinogenic risk assessment. In this non-linear approach, a “point of departure” is identified below which carcinogenic effects are not expected. The point of departure is typically a NOAEL based on an endpoint related to cancer effects though it may be a different value derived from the dose response curve. To estimate risk, a ratio of the point of departure to exposure (MOEcancer* point of departure/exposure) is calculated. A summary of the toxicological endpoints for thiacloprid used for human risk assessment is shown in Table 3 of this unit:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

UF = uncertainty factor, NOAEL = no observed adverse effect level, LOAEL = lowest observed adverse effect level, PAD = population adjusted dose (a = acute, c = chronic) RID = reference dose

* The reference to the FQPA SF refers to any additional SF retained due to concerns unique to the FQPA.

C. Exposure Assessment

1. Dietary exposure from food and feed uses. There are no tolerances established for residues of thiacloprid. Risk assessments were conducted by EPA to assess dietary exposures from thiacloprid in food as follows:

i. Acute exposure. Acute dietary risk assessments are performed for a food-use pesticide if a toxicological study has indicated the possibility of an effect of concern occurring as a result of a one day or single exposure. The Dietary Exposure Evaluation Model (DEEM™) analysis evaluated the individual food consumption as reported by respondents in the USDA 1994–1996 and 1998 nationwide Continuing Surveys of Food Intake by Individuals (CSFII) and accumulated exposure to the chemical for each commodity. The following assumptions were made for the acute exposure assessments: A moderately refined, Tier 3 acute dietary exposure assessment, which incorporated field trial data, estimates of % market share, and empirical processing factors, was conducted for the general U.S. population and various population subgroups. Monitoring data are not available for thiacloprid as it is a new chemical. EPA estimated exposure at the 99.9th exposure percentile.

ii. Chronic exposure. In conducting this chronic dietary risk assessment the Dietary Exposure Evaluation Model (DEEM™) analysis evaluated the individual food consumption as reported by respondents in the USDA 1994–1996 and 1998 nationwide Continuing Surveys of Food Intake by Individuals (CSFII) and accumulated exposure to the chemical for each commodity. The following assumptions were made for the chronic exposure assessments: A partially refined, Tier 3 chronic dietary exposure assessment, which incorporated field trial data, empirical processing factors, and projected percent crop treated estimates, was conducted for the general U.S. population and various population subgroups. Monitoring data are not available for thiacloprid as it is a new chemical.

iii. Cancer. A cancer assessment was performed using the same assumptions as the chronic assessment in Unit III.C.1. ii. The cancer dietary exposure estimate for the general U.S. population is 1.3 x 10^-6.

iv. Anticipated residue and percent crop treated (PCT) information. Section 408(b)(2)(E) of the FFDCA authorizes EPA to use available data and information on the anticipated residue levels of pesticide residues in food and the actual levels of pesticide chemicals that have been measured in food. If EPA relies on such information, EPA must require that data be provided 5 years after the tolerance is established, modified, or left in effect, demonstrating that the levels in food are not above the levels anticipated. Following the initial data submission, EPA is authorized to require similar data on a time frame it deems appropriate. As required by section 408(b)(2)(E) of the FFDCA, EPA will issue a data call-in for information relating to anticipated residues to be submitted no later than 5 years from the date of issuance of this tolerance.

Section 408(b)(2)(F) of the FFDCA states that the Agency may use data on the actual percent of food treated for assessing chronic dietary risk only if the Agency can make the following findings: Condition 1, that the data used are reliable and provide a valid basis to show what percentage of the food derived from such crop is likely to contain such pesticide residue; and Condition 2, that the exposure estimate does not underestimate exposure for any significant subgroup population; and
Condition 3, if data are available on pesticide use and food consumption in a particular area, the exposure estimate does not underestimate exposure for the population in such area. In addition, the Agency must provide for periodic evaluation of any estimates used. To provide for the periodic evaluation of the estimate of PCT as required by section 408(b)(2)(B) of the FFDCA, EPA may require registrants to submit data on PCT.

The Agency used PCT information for both the acute and chronic dietary risk assessment as follows:

- A routine acute and chronic dietary exposure analysis for thiacloprid was based on 61% of apple crop treated, 51% of pear crop treated and 1% of cotton crop treated.

  The Agency believes that the three conditions previously discussed have been met. With respect to Condition 1, EPA finds that the PCT information described in the preceding paragraph for thiacloprid used on these crops is reliable and has a valid basis. The PCT estimates are based on use of existing alternate insecticides against insects that thiacloprid will control. As per Agency practice, the PCT estimates are what the Agency expects to be likely upper bound market penetrations for various crop/pest niches. Maximal percent crop treated estimates were projected for apples, pears, and cotton. The Agency is reasonably certain that the percentage of the food treated is not likely to be an underestimation. As to Conditions 2 and 3, regional consumption information and consumption information for significant subpopulations is taken into account through EPA’s computer-based model for evaluating the exposure of significant subpopulations including several regional groups. Use of this consumption information in EPA’s risk assessment process ensures that EPA’s exposure estimate does not underestimate exposure for any significant subpopulation group and allows the Agency to be reasonably certain that no regional population is exposed to residue levels higher than those estimated by the Agency. Other than the data available through national food consumption surveys, EPA does not have available information on the regional consumption of food to which thiacloprid may be applied in a particular area.

2. Dietary exposure from drinking water. The Agency lacks sufficient monitoring exposure data to complete a comprehensive dietary exposure analysis and risk assessment for thiacloprid in drinking water. Because the Agency does not have comprehensive monitoring data, drinking water concentration estimates are made by reliance on simulation or modeling taking into account data on the physical characteristics of thiacloprid.

The Agency uses the First Index Reservoir Screening Tool (FIRST) or the Pesticide Root Zone/Exposure Analysis Modeling System (PRZM/EXAMS) to produce estimates of pesticide concentrations in an index reservoir. The SCI-GROW model is used to predict pesticide concentrations in shallow groundwater. For a screening-level assessment for surface water EPA will use FIRST (a tier 1 model) before using PRZM/EXAMS (a tier 2 model). The FIRST model is a subset of the PRZM/EXAMS model that uses a specific high-end runoff scenario for pesticides.

While both FIRST and PRZM/EXAMS incorporate an index reservoir environment, the PRZM/EXAMS model includes a percent crop area factor as an adjustment to account for the maximum percent crop coverage within a watershed or drainage basin. The Tier II screening model, PRZM/EXAMS, was used to estimate residues of thiacloprid and one of its major degradates, YRC 2894 amide in surface water. The SCI-GROW model was used to estimate the ground water residues.

None of these models include consideration of the impact processing (mixing, dilution, or treatment) of raw water for distribution as drinking water. While both FIRST and PRZM/EXAMS would likely have on the removal of pesticides from the source water. The primary use of these models by the Agency at this stage is to provide a coarse screen for sorting out pesticides for which it is highly unlikely that drinking water concentrations would ever exceed human health levels of concern.

Since the models used are considered to be screening tools in the risk assessment process, the Agency does not use estimated environmental concentrations (EECs) from these models to quantify drinking water exposure and risk as a %RfD or %PAD. Instead drinking water levels of comparison (DWLOCs) are calculated and used as a point of comparison against the model estimates of a pesticide’s concentration in water. DWLOCs are theoretical upper limits on a pesticide’s concentration in drinking water in light of total aggregate exposure to a pesticide in food, and from residential uses. Since DWLOCs address total aggregate exposure to thiacloprid they are further discussed in the aggregate risk sections in Unit III.E. Based on the PRZM/EXAMS and SCI-GROW models the estimated environmental concentrations (EECs) of thiacloprid and one of its major degradates, YRC 2894 amide for acute exposures are estimated to be 10.2 parts per billion (ppb) for surface water and 0.06 ppb for ground water. The EECs for chronic exposures are estimated to be 2.36 ppb for surface water and 0.06 ppb for ground water.

3. From non-dietary exposure. The term “residential exposure” is used in this document to refer to non-occupational, non-dietary exposure (e.g., for lawn and garden pest control, indoor pest control, termicidIES, and flea and tick control on pets). Thiacloprid is not registered or proposed for use on any sites that would result in residential exposure.

4. Cumulative exposure to substances with a common mechanism of toxicity. Cumulative effects from substances with a common mechanism of toxicity. Section 408(b)(2)(D)(v) of the FFDCA requires that, when considering whether to establish, modify, or revoke a tolerance, the Agency consider available information concerning the cumulative effects of a particular pesticide’s residues and other substances that have a common mechanism of toxicity. EPA does not have, at this time, available data to determine whether thiacloprid has a common mechanism of toxicity with other substances. Unlike other pesticides for which EPA has followed a cumulative risk approach based on a common mechanism of toxicity, EPA has not made a common mechanism of toxicity finding as to thiacloprid and any other substances and thiacloprid does not appear to produce a toxic metabolite produced by other substances. Thiacloprid does produce 6-CNA, a metabolite also produced by another registered chloronicotinoid pesticide. However, the limiting toxic endpoints used in this assessment for thiacloprid are not based upon the toxicity of 6-CNA. For the purposes of this tolerance action, therefore, EPA has not assumed that thiacloprid has a common mechanism of toxicity with other substances. For information regarding EPA’s efforts to determine which chemicals have a common mechanism of toxicity and to evaluate the cumulative effects of such chemicals, see the policy statements released by EPA’s Office of Pesticide Programs concerning common mechanism determinations and procedures for cumulating effects from substances found to have a common mechanism on EPA’s website at http://www.epa.gov/pesticides/cumulative/.
D. Safety Factor for Infants and Children

1. In general. Section 408 of the FFDCA provides that EPA shall apply an additional tenfold margin of safety for infants and children in the case of threshold effects to account for prenatal and postnatal toxicity and the completeness of the data base on toxicity and exposure unless EPA determines that a different margin of safety will be safe for infants and children. Margins of safety are incorporated into EPA risk assessments either directly through use of a MOE analysis or through using uncertainty (safety) factors in calculating a dose level that poses no appreciable risk to humans.

2. Prenatal and postnatal sensitivity. Developmental studies did not show either qualitative or quantitative susceptibility. There is no increase in quantitative susceptibility demonstrated in the rat developmental neurotoxicity, rabbit developmental or rat reproduction studies. There is an apparent qualitative increase in susceptibility in the rat developmental toxicity study as indicated by increases in resorptions, increases in skeletal variations and retardations and malformations, and decreases in fetal body weight that occurred at the same dose showing a decrease in maternal body weight, but the concern is low since:
   i. There is a well characterized dose response with a clear NOAEL and LOAEL:
      ii. The fetal effects were noted in the presence of maternal toxicity; and
      iii. There are no residual uncertainties.

3. Conclusion. In evaluating whether to retain the 10X SF to protect infants and children or to select a different safety factor, EPA considered the following factors:
   i. There are no special concerns regarding pre- or post-natal toxicity exposure;
   ii. The exposure databases (food and drinking water) are complete and/or employ conservative assumptions;
   iii. There is no residential exposure;
   iv. The risk assessments cover or account for all the metabolites and degrades of concern;
   v. The assessments do not underestimate the potential risk for infants and children; and
   vi. The toxicity database is complete except that there is a lack of morphometric assessments for the low and mid-dose group animals in the developmental neurotoxicity study (DNT).

Although the lack of morphometric assessments in the DNT raised some uncertainty, EPA determined that there were sufficient reliable data to select an additional safety factor of 3X instead of 10X. The FQPA safety factor of 3X is in the form of a database uncertainty factor of 3X. A 3X factor was judged to be adequate because the dose selected for overall risk assessments is already based on the most sensitive end points for acute (i.e. clinical signs indicative of neurotoxicity) and chronic (i.e. liver and thyroid effects) dietary and non-diary exposure scenarios, and the available data indicate that the full characterization of brain morphometrics from the DNT study would not be expected to lower the dose used for risk assessments by more than 3-fold.

To elaborate, since the magnitude (4-14%) of the morphometric histopathology changes seen in the offspring at the highest dose (40.8 mg/kg/day) in the developmental neurotoxicity study were considered to be at or near the limit of detection for differences in morphometric measurements, it is unlikely that measurable morphometric changes will be seen at lower doses. Any possible slight effects at lower doses are highly unlikely to change the regulatory level. The actual doses used to establish the acute RfD (3.1 mg/kg/day) and the chronic RfD (1.2 mg/kg/day) are 13 and 34 fold lower, respectively, than the 40.8 mg/kg/day dose where the effects of minimal magnitude were seen. Applying the 3 X factor further renders the adjusted doses 39 and 102-fold lower than the dose level where the effects of minimal magnitude were seen. Moreover, even if the slight morphometric changes are seen at the mid, and even the lower, dose of the DNT, a RfD calculated on such findings is highly unlikely to be lower than current acute and chronic RfDs adjusted by 3X given that the effects seen at the high dose were marginal. Therefore it is concluded that 3X is adequate to account for any possible morphometric effects that may be noted in the lower doses for which the additional readings are being sought.

E. Aggregate Risks and Determination of Safety

To estimate total aggregate exposure to a pesticide from food, drinking water, and residential uses, the Agency calculates DWLOCs which are used as a point of comparison against the model estimates of a pesticide’s concentration in water (EECs). DWLOC values are not regulatory standards for drinking water. DWLOCs are theoretical upper limits on a pesticide’s concentration in drinking water in light of total aggregate exposure to a pesticide in food and residential uses. In calculating a DWLOC, the Agency determines how much of the acceptable exposure (i.e., the PAD) is available for exposure through drinking water [e.g., allowable chronic water exposure (mg/kg/day) = cPAD - (average food + residential exposure)]. This allowable exposure through drinking water is used to calculate a DWLOC.

A DWLOC will vary depending on the toxic endpoint, drinking water consumption, and body weights. Default body weights and consumption values as used by the USEPA Office of Water are used to calculate DWLOCs: 2 liter (L)/70 kg (adult male), 2L/60 kg (adult female), and 1L/10 kg (child). Default body weights and drinking water consumption values vary on an individual basis. This variation will be taken into account in more refined screening-level and quantitative drinking water exposure assessments. Different populations will have different DWLOCs. Generally, a DWLOC is calculated for each type of risk assessment used: Acute, short-term, intermediate-term, chronic, and cancer.

When EECs for surface water and groundwater are less than the calculated DWLOCs, OPP concludes with reasonable certainty that exposures to the pesticide in drinking water (when considered along with other sources of exposure for which OPP has reliable data) would not result in unacceptable levels of aggregate human health risk at this time. Because OPP considers the aggregate risk resulting from multiple exposure pathways associated with a pesticide’s uses, levels of comparison in drinking water may vary as those uses change. If new uses are added in the future, OPP will reassess the potential impacts of residues of the pesticide in drinking water as a part of the aggregate risk assessment process.

1. Acute risk. Using the exposure assumptions discussed in this unit for acute exposure, the acute dietary exposure from food to thiacloprid will occupy 20% of the aPAD for the U.S. population, 8.5% of the aPAD for females 13 years and older, 51% of the aPAD for all infants and 47% of the aPAD for children 1-2 years old. In addition, there is potential for acute dietary exposure to thiacloprid in drinking water. After calculating DWLOCs and comparing them to the EECs for surface and ground water, EPA does not expect the aggregate exposure to exceed 100% of the aPAD, as shown in Table 4 of this unit:
2. Chronic risk. Using the exposure assumptions described in this unit for chronic exposure, EPA has concluded that exposure to thiacloprid from food will utilize <1.0% of the cPAD for the U.S. population, 4.4% of the cPAD for all infants and 4.2% of the cPAD for children 1-2 years old. There are no residential uses for thiacloprid that result in chronic residential exposure to thiacloprid. In addition, there is potential for chronic dietary exposure to thiacloprid in drinking water. After calculating DWLOCs and comparing them to the EECs for surface and ground water, EPA does not expect the aggregate exposure to exceed 100% of the cPAD, as shown in Table 5 of this unit:

### Table 4.—Aggregate Risk Assessment for Acute Exposure to Thiacloprid

3. Short-term risk. Short-term aggregate exposure takes into account residential exposure plus chronic exposure to food and water (considered to be a background exposure level). Thiacloprid is not registered or proposed for use on any sites that would result in residential exposure. Therefore, the aggregate risk is the sum of the risk from food and water, which do not exceed the Agency’s level of concern.

4. Intermediate-term risk. Intermediate-term aggregate exposure takes into account residential exposure plus chronic exposure to food and water (considered to be a background exposure level). Thiacloprid is not registered or proposed for use on any sites that would result in residential exposure. Therefore, the aggregate risk is the sum of the risk from food and water, which do not exceed the Agency’s level of concern.

5. Aggregate cancer risk for U.S. population. In accordance with the EPA Draft Guidelines for Carcinogen Risk Assessment: (July 1999), thiacloprid was classified into the category Likely to be Carcinogenic to Humans. A linear low-dose extrapolation approach is applied to the quantifications of risk to be estimated, based upon male rat thyroid, rat uterine, and mouse ovarian tumors. The data did not support a mode of action. The Q1* is 4.06 x 10⁻² in human equivalents based on the rat uterine adenoma, adenocarcinoma and/or adenosquamous carcinoma combined tumor rates.

The dietary cancer risk from residues in food is 1.3 x 10⁻⁶. A cancer DWLOC is calculated only for the general U.S. Population. For this population the calculated DWLOC of 1.5ug/L is the same as the calculated EEC of 1.5 ug/L. DWLOC = 3 x 10⁻⁶/Q1* - average food exposure (mg/kg/day])bwt* 1,000 ug/mg-water consumption (liter/day)

For risk management purposes, EPA considers a cancer risk to be greater than negligible when it exceeds the range of 1 in 1 million. EPA has generally treated cancer risks up to 3 in 1 million as within the range of 1 in 1 million. EPA believes that the lifetime exposure will be result in negligible cancer risk for the following reason:

The cancer risk from the food uses alone is 1.3 x 10⁻⁶. The dietary risk is based on residue data derived from the average of field trials. It is not unusual in the Agency’s experience for field trial data to be an order of magnitude above actual monitoring. Since thiacloprid is a new chemical, actual monitoring data are not yet available. It is likely that the actual risk contribution from food will be much lower than current data indicate, which would result in a larger DWLOCcancer.

Thus, EPA does not expect that the general population would be exposed to levels that would exceed a negligible cancer risk over a lifetime.

6. Determination of safety. Based on these risk assessments, EPA concludes that there is a reasonable certainty that no harm will result to the general population.
IV. Other Considerations

A. Analytical Enforcement Methodology

The petitioner proposed a high performance liquid chromatography mass spectrometry (HPLC/MS/MS) method for determining thiacloprid, YRC-2794 amide and 4-hydroxy-YRC2794 amide in plants which has been found to be appropriate for use in the enforcement of the plant tolerances associated with this petition. The available radiovalidation and metabolism data supports this method. An adequate Independent Lab Validation (ILV) has been provided for the method and adequate confirmatory ions were also identified in the ILV.

The petitioner has proposed a HPLC/MS/MS method for determining thiacloprid in livestock tissues which has been found to be appropriate for use in the enforcement of the animal tissue tolerances associated with this petition. Existing radiovalidation and metabolism data supports this method as well as does an ILV. Mass spectrometry provides an adequate confirmatory method. This conclusion is based upon the successful use of mass spectrometry as a confirmatory method for thiacloprid in plants, the similarity between the HPLC/MS/MS methods for thiacloprid in plants and animals, and the Agency’s familiarity with mass spectrometry in general. As a condition of registration, the registrant will be required to submit a description of the procedures for the use of mass spectrometry for thiacloprid in animals.

Thiacloprid, parent only, has been tested through the FDA PAM I multi-residue protocol. Upon request, the methods will be available prior to the harvest from: Chief, Analytical Chemistry Branch, Environmental Science Center, 701 Mapes Rd., Ft. Meade, MD 20755–5356; telephone number: (410) 305–2905; e-mail address: residuemethods@epa.gov.

B. International Residue Limits

There are no established Codex, Canadian or Mexican maximum residue limits (MRLs) for thiacloprid.

C. Conditions

The following information must be submitted as a condition for product registrations related to these tolerances: The registrant will be required to submit a description of the procedures for the use of mass spectrometry for thiacloprid in animals.

V. Conclusion

Therefore, tolerances are established for combined residues of thiacloprid and metabolites retaining the thiazolidine ring intact, measured and expressed as thiacloprid, per se, in or on apple, wet pomace at 0.6 ppm; cattle, sheep, goat, and horse meat at 0.03 ppm; cattle, sheep, goat and horse meat byproducts at 0.05 ppm; cattle, sheep, goat, and horse liver at 0.15 ppm; cattle, sheep, goat and horse kidney at 0.05 ppm; and cattle sheep, goat, and horse fat at 0.02 ppm; cotton, undelinted seed at 0.02 ppm; cotton, gin byproducts at 11.0 ppm; fruit, pome, group 11 at 0.3 ppm; and milk at 0.03 ppm.
special considerations under Executive Order 12898, entitled Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations (59 FR 7629, February 16, 1994); or OMB review or any Agency action under Executive Order 13045, entitled Protection of Children from Environmental Health Risks and Safety Risks (62 FR 19885, April 23, 1997). This action does not involve any technical standards that would require Agency consideration of voluntary consensus standards pursuant to section 12(d) of the National Technology Transfer and Advancement Act of 1995 (NTTAA), Public Law 104–113, section 12(d) (15 U.S.C. 272 note). Since tolerances and exemptions that are established on the basis of a petition under section 408(d) of the FFDCA, such as the tolerance in this final rule, do not require the issuance of a proposed rule, the requirements of the Regulatory Flexibility Act (RFA) (5 U.S.C. 601 et seq.) do not apply. In addition, the Agency has determined that this action will not have a substantial direct effect on States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132, entitled Federalism (64 FR 43255, August 10, 1999). Executive Order 13132 requires EPA to develop an accountable process to ensure “meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications.” “Policies that have federalism implications” is defined in the Executive order to include regulations that have “substantial direct effects on one or more Indian tribes, on the relationship between the Federal Government and Indian tribes, or on the distribution of power and responsibilities between the Federal Government and Indian tribes.” This rule will not have substantial direct effects on tribal governments, on the relationship between the Federal Government and Indian tribes, or on the distribution of power and responsibilities between the Federal Government and Indian tribes, as specified in Executive Order 13175. Thus, Executive Order 13175 does not apply to this rule.

VIII. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 et seq., as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of this final rule in the Federal Register. This final rule is not a “major rule” as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 180

Environmental protection, Administrative practice and procedure, Agricultural commodities, Pesticides and pests, Reporting and recordkeeping requirements.

James Jones,
Director, Office of Pesticide Programs.

Therefore, 40 CFR chapter I is amended as follows:

PART 180—[AMENDED]

1. The authority citation for part 180 continues to read as follows:

Authority: 21 U.S.C. 321(q), 346(a) and 371.

2. Section 180.594 is added to read as follows:

§ 180.594 Thiacloprid; tolerances for residues.

(a) General. Tolerances for combined residues of the insecticide thiacloprid
nonbell pepper. Interregional Research Project Number 4 (IR–4) requested these tolerances under the Federal Food, Drug, and Cosmetic Act (FFDCA), as amended by the Food Quality Protection Act of 1996 (FQPA). EPA is also deleting certain fenhexamid tolerances that are no longer needed as a result of this action.

**DATES:** This regulation is effective September 26, 2003. Objections and requests for hearings, identified by docket ID number OPP–2003–0301, must be received on or before November 25, 2003.

**ADDRESSES:** Written objections and hearing requests may be submitted electronically, by mail, or through hand delivery/courier. Follow the detailed instructions as provided in Unit VI. of the SUPPLEMENTARY INFORMATION.

**FOR FURTHER INFORMATION CONTACT:** Hoyt Jamerson, Registration Division (7505C), Office of Pesticide Programs, Environmental Protection Agency, 1200 Pennsylvania Ave., NW, Washington, DC 20460–0001; telephone number: (703) 308–9368; e-mail address: jamerson.hoyt@epa.gov.

**SUPPLEMENTARY INFORMATION: I. General Information A. Does this Action Apply to Me?** You may be potentially affected by this action if you are an agricultural producer, food manufacturer, or pesticide manufacturer. Potentially affected entities may include, but are not limited to:

- Industry (NAICS 111), e.g., Crop production.
- Industry (NAICS 112), e.g., Animal production.
- Industry (NAICS 311), e.g., Food manufacturing.
- Industry (NAICS 32532), e.g., Pesticide manufacturing.

This listing is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be affected by this action. Other types of entities not listed in this unit could also be affected. The North American Industrial Classification System (NAICS) codes have been provided to assist you and others in determining whether this action might apply to certain entities. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed under FOR FURTHER INFORMATION CONTACT.

**B. How Can I Get Copies of this Document and Other Related Information?** 1. **Docket.** EPA has established an official public docket for this action under docket identification (ID) number OPP–2003–0301. The official public docket consists of the documents specifically referenced in this action, any public comments received, and other information related to this action. Although a part of the official docket, the public docket does not include Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. The official public docket is the collection of materials that is available for public viewing at the Public Information and Records Integrity Branch (PIRIB), Rm. 119, Crystal Mall #2, 2121 Jefferson Davis Hwy., Arlington, VA. This docket facility is open from 8:30 a.m. to 4 p.m., Monday through Friday, excluding legal holidays. The docket telephone number is (703) 305–5805.

2. **Electronic access.** You may access this Federal Register document electronically through the EPA Internet under the “Federal Register” listings at http://www.epa.gov/fedregstr/. A frequently updated electronic version of 40 CFR part 180 is available at http://www.access.gpo.gov/nara/cfr/cfrhtml/40/40fr180_00.html/, a beta site currently under development. An electronic version of the public docket is available through EPA’s electronic public docket and comment system, EPA Dockets. You may use EPA Dockets at http://www.epa.gov/edocket/ to submit or view public comments, access the index listing of the contents of the official public docket, and to access those documents in the public docket that are available electronically. Although not all docket materials may be available electronically, you may still access any of the publicly available docket materials through the docket facility identified in Unit I.B.1. Once in the system, select “search,” then key in the appropriate docket ID number.

**II. Background and Statutory Findings** In the Federal Register of May 21, 2003 (68 FR 27799) (FRL–7308–4), EPA issued a notice pursuant to section 408 of FFDCA, 21 U.S.C. 346a, as amended by FQPA (Public Law 104–170), announcing the filing of a pesticide petition (PP 2E6463, 2E6496, 3E6532, and 3E6541) by IR–4, 681 U.S. Highway #1 South, North Brunswick, NJ 08902–3390. That notice included a summary of the petitions prepared by Arvesta Corporation, 100 First Street, Suite 1700, San Francisco, CA 94105, the registrant. There were no comments received in response to the notice of filing. The petitions requested that 40 CFR 180.553 be amended by establishing tolerances for residues of the fungicide...
